

HW16-Team: Storyboarding (2 p)

Fall 2025

Project Team number and name: Team2, MediVault

Names of students who actively worked on this assignment:

- Aditya Girish Anand
- Dorian Chirackal
- Karishma Bahl
- Matthieu Delatour
- Sangeetha Phaneesh

Instructions

- See slides (UX 3-Wireframing). Make sure to check the links to additional resources on the slides.
- Get Balsamiq (web version of the 14-day trial) and play with it: <https://balsamiq.com/> .
Note, there is a way to collaborate as a team, using Balsamiq Google Drive chrome plugin: <https://chrome.google.com/webstore/detail/balsamiq-wireframes-free/imbfadckkgblfbkinjejdeobpfbcopgb?hl=en>

NOTE: It is ok to use other wireframing tool, if your team prefers.

Create a storyboard for your product:

1a) First, sketch ideas by hand for your product. Take photos (use proper lighting and image quality), insert into this doc (below), save as **pdf** and upload on Canvas. Make sure frames are large enough for us to review: 1p.

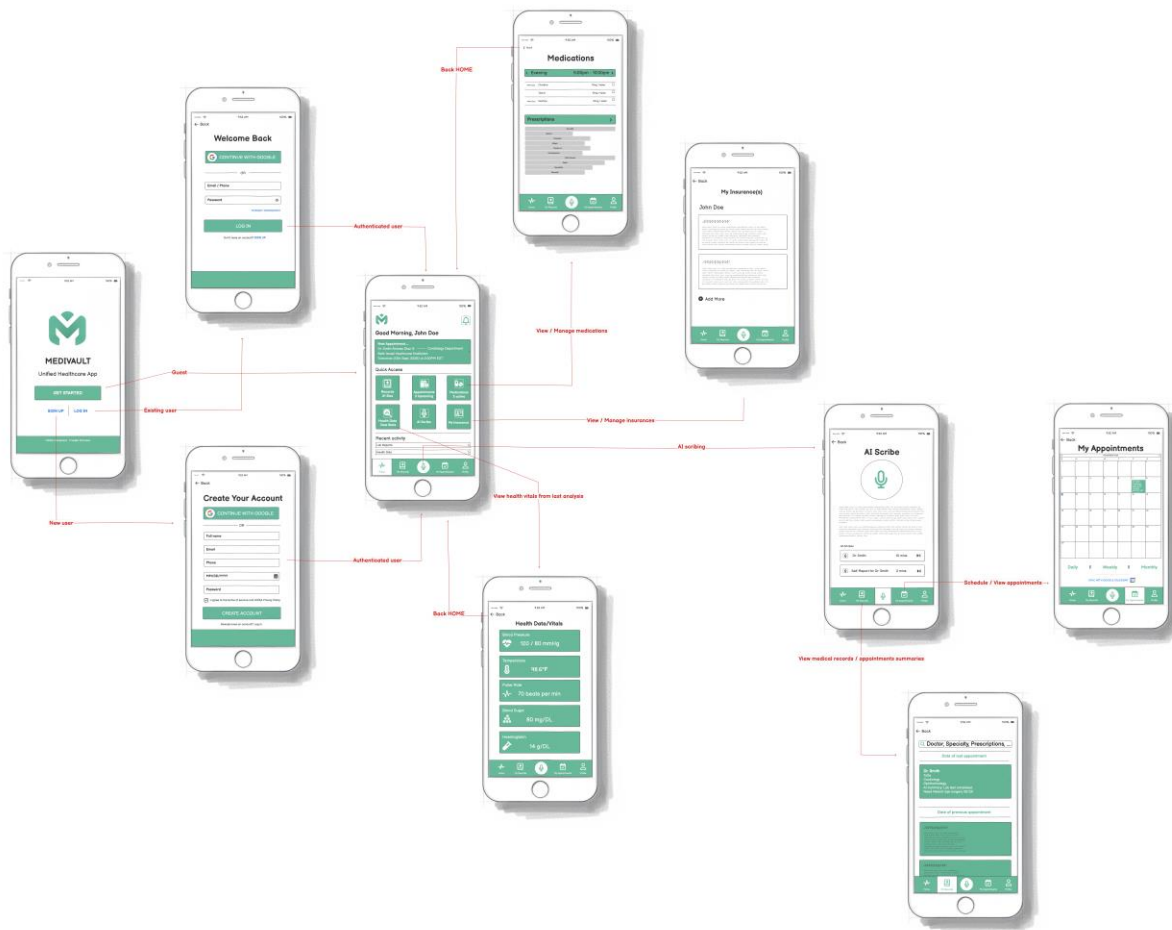

1b) Second, using Balsamiq (or other tool), create lo-fi wires and arrange them in a storyboard (first decide on activity that a target customer would perform and then describe it using the storyboard. The reader should be able to see clearly the triggers and sequence of events. Upload on Canvas as **pdf**. Make sure frames are large enough for us to review, see the PRD Report Examples: 1p.

NOTE: upload these two files separately.

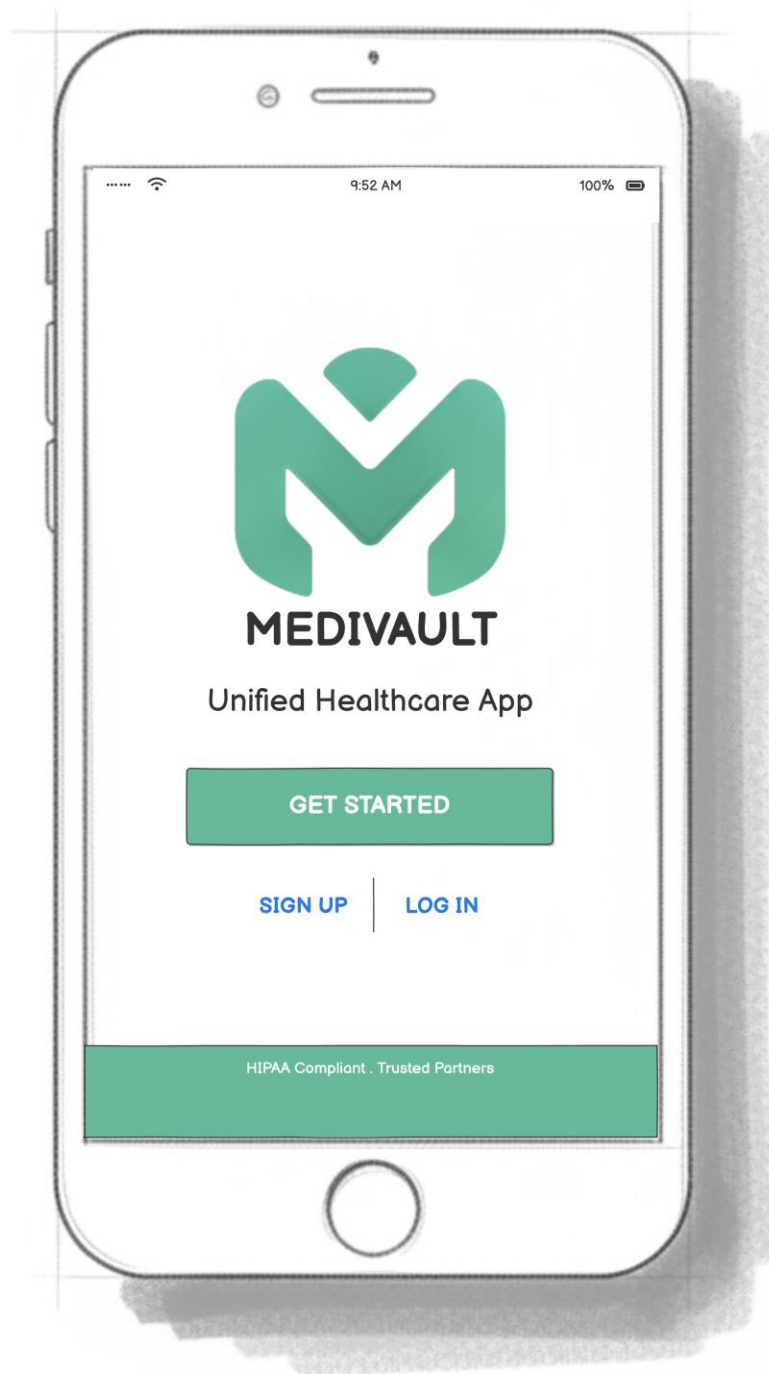

Page limit for Sketches or Storyboard: ten (not including Instructions).

1b) Wires and Storyboard

In this section, we have explained a user's journey, who is using the app to check their upcoming appointments, glance through their medications, and scribes to keep track of the health data. This example is for our customer segment of new parents. PS – We have included the entire storyboard on the first page to view it at a glance and then described every step on the pages that follow, including sign up for a new user.

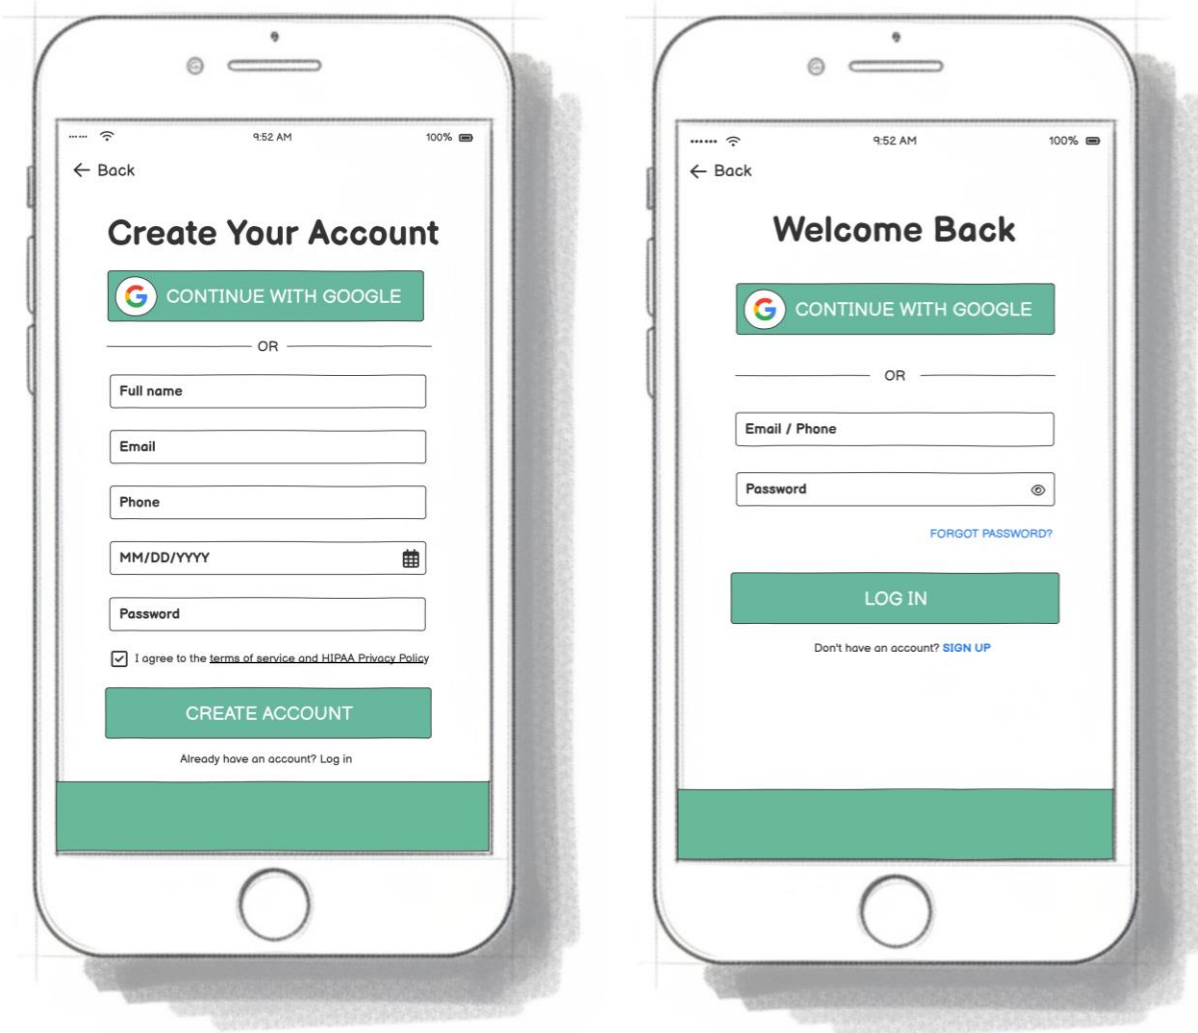

Description: Entire storyboard.

Screen1 Landing Screen: A user downloaded the app from their phone's app store, and they see a screen that has three options— 'Get Started' to browse the app's features as a guest (aimed to increase downloads and minimize resistance), 'Sign Up' to create an account by providing basic biographic details, 'Log In' to access MediVault account by providing E-mail or Phone number and password.

Additionally, on this screen, the user is also looking at our logo, tag line, compliance, and trusted partners (as part of the UX to establish credibility and connection using consistent branding).

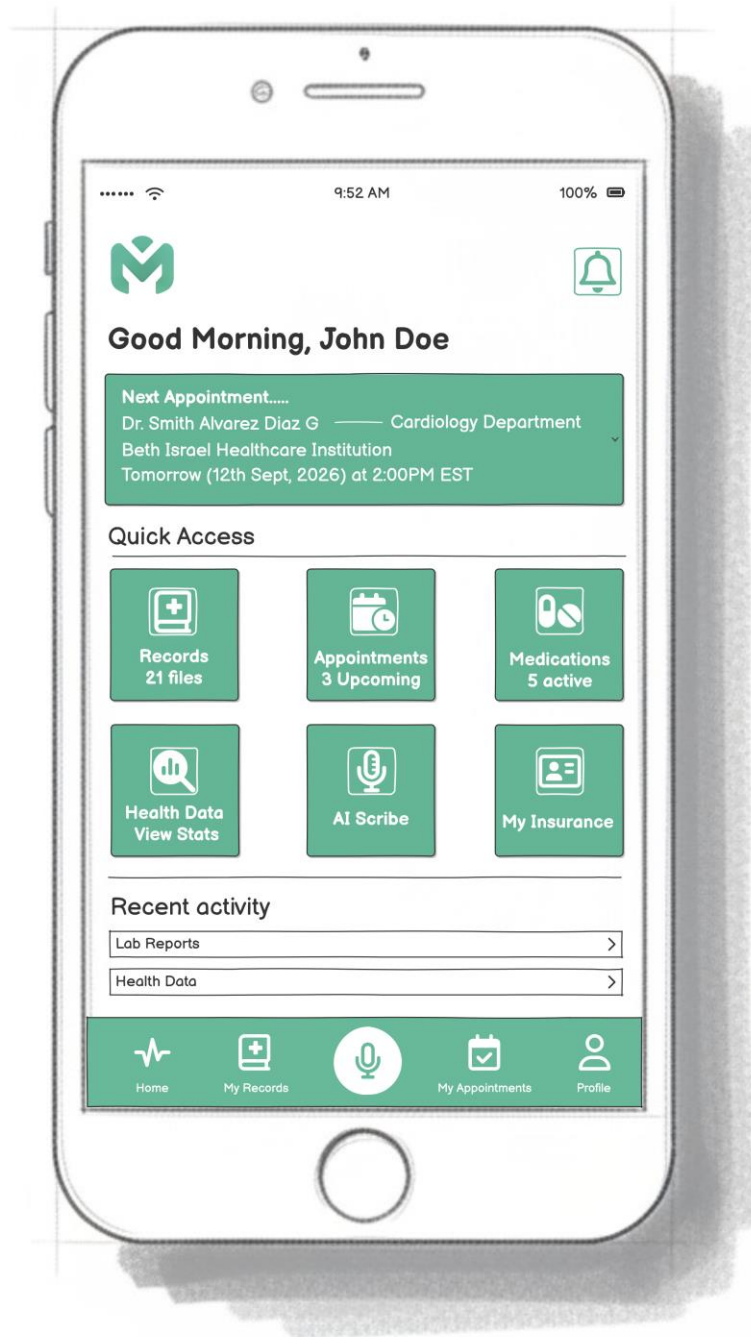

Screen2 Sign Up: User clicked on 'Sign Up' on the landing page and reached this screen. They can sign up using their Google account or type their basic biographic information in the form fields, a password, and click on the checkbox to agree to terms and conditions and click on 'Create Account' to complete the process.

Additionally, on this screen, using Google lets the user login with their Gmail account. The DOB can be typed or entered using a calendar by clicking on the calendar icon. They can click on the 'terms of service and HIPAA Privacy Policy' to view the terms. They can use the 'Back' button to return to the landing screen. They can also click on 'Log In'.

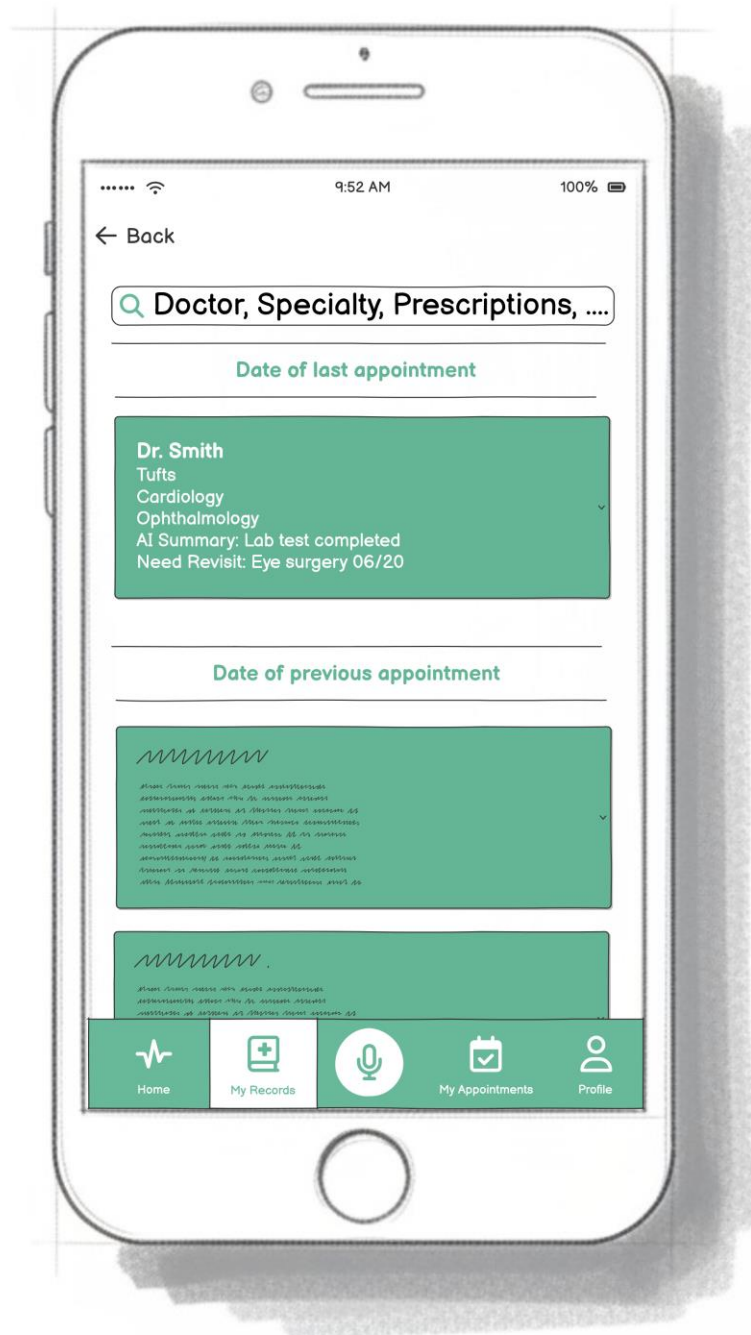

Screen3 Login: User reached this page after completing the sign-up process OR after clicking 'Log In' on the Landing Screen.

User entered either their email or phone used at sign up and the password then clicked on 'Log In' to authenticate and access their account.

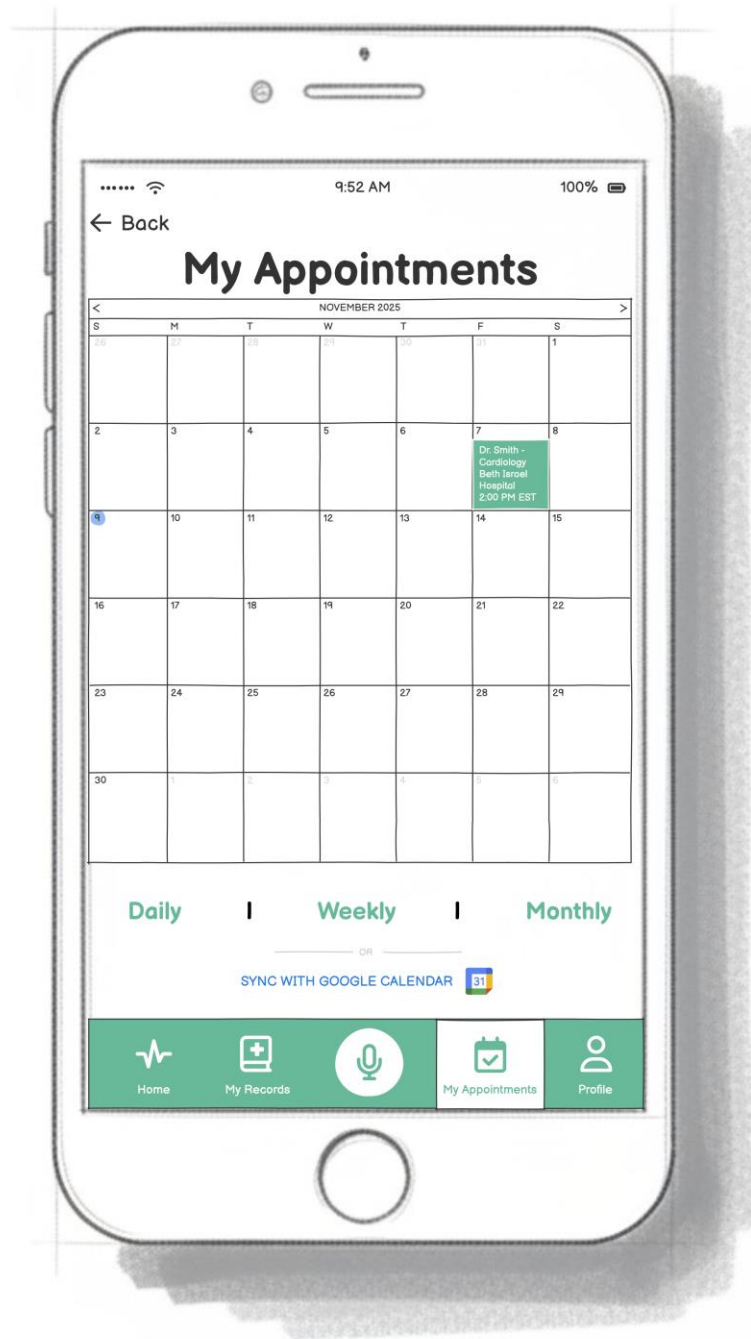

Additionally, on this screen, login using Google. Click the eye icon to see the password. Click 'Forgot Password' to reset password. Click on 'Sign Up' to go to that screen.

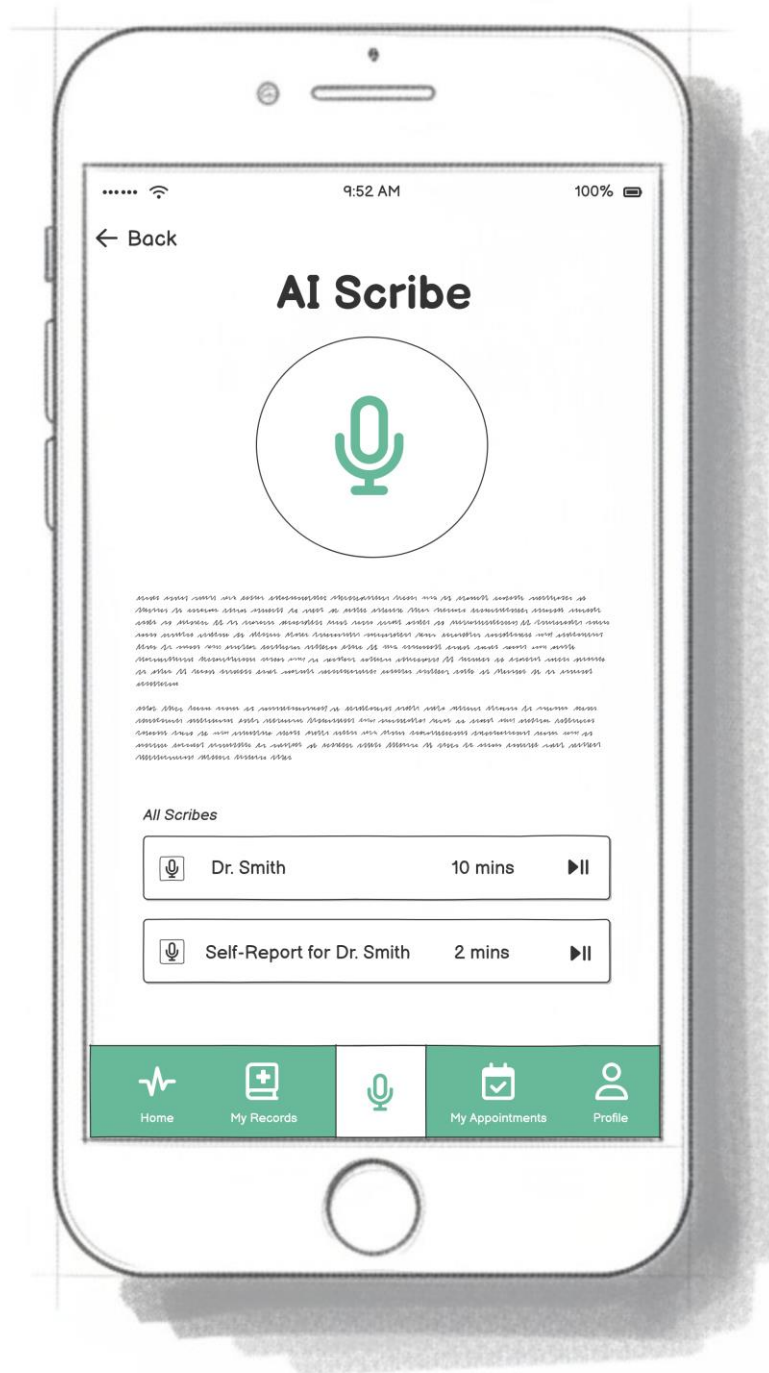

Screen4 Main Screen: The parent (John) has authenticated and logged in and reached the main screen. The parent is looking at their upcoming appointment(s) on the first part of their screen; they can tap on it to view multiple appointments as applicable- they can see a summary of the appointment, like doctor information, location and time. They can click on any of the tiles in the Quick Access section. They can also scroll through recent activities and navigate from there. There is a navigation bar at the bottom of the screen. Additionally, if they click on the bell icon, they can view notifications, if any.

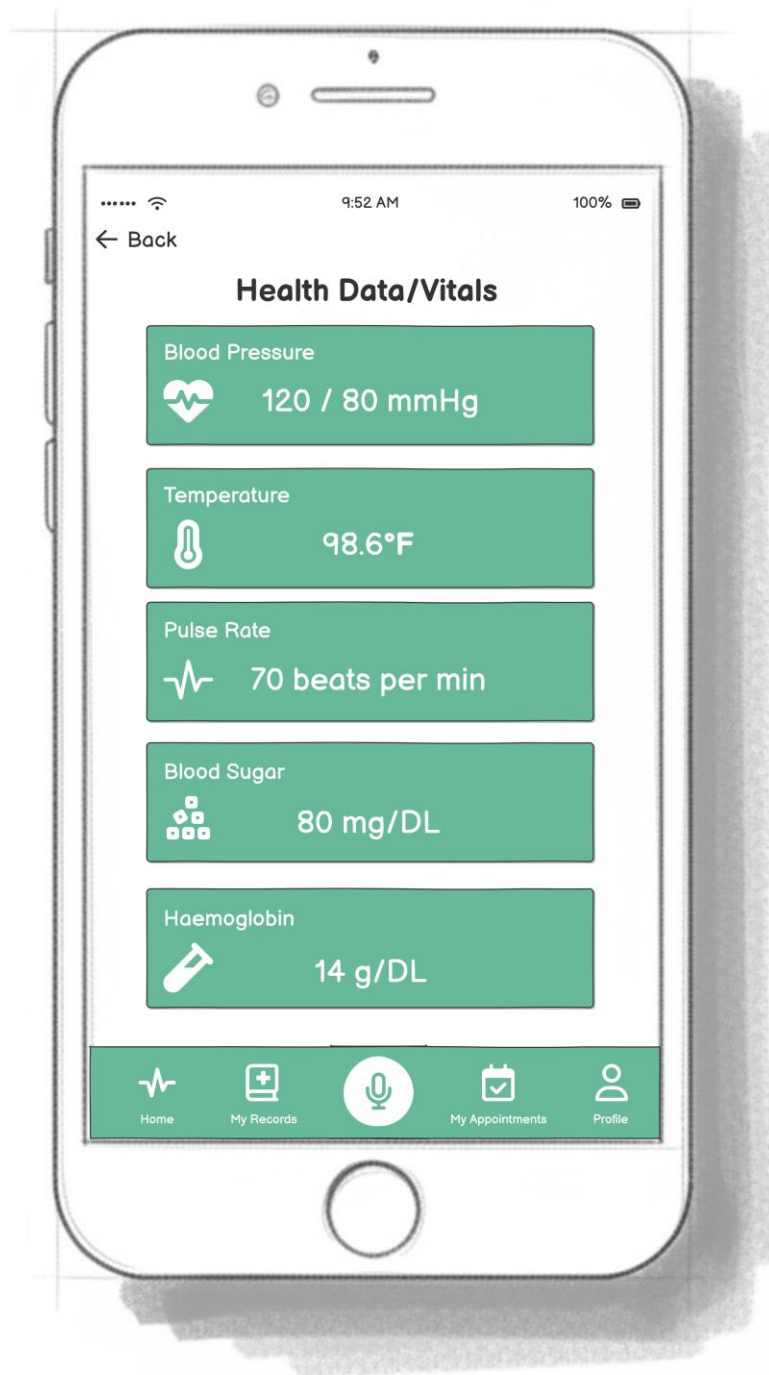

Screen5 My Records: John clicked on 'My Records' in the navigation bar and reached this screen. He is looking at a summary of records from the most recent appointment; he can click on it to see more details such as each file linked to that appointment. And the screen is further sectioned by date of appointments in a reverse chronological order. The summary cards are tagged by child's name, as applicable. They can use the smart search bar to locate any records using doctor's name, specialty term, hospital name, file name or other keywords and that would show them any records that match the words they entered.

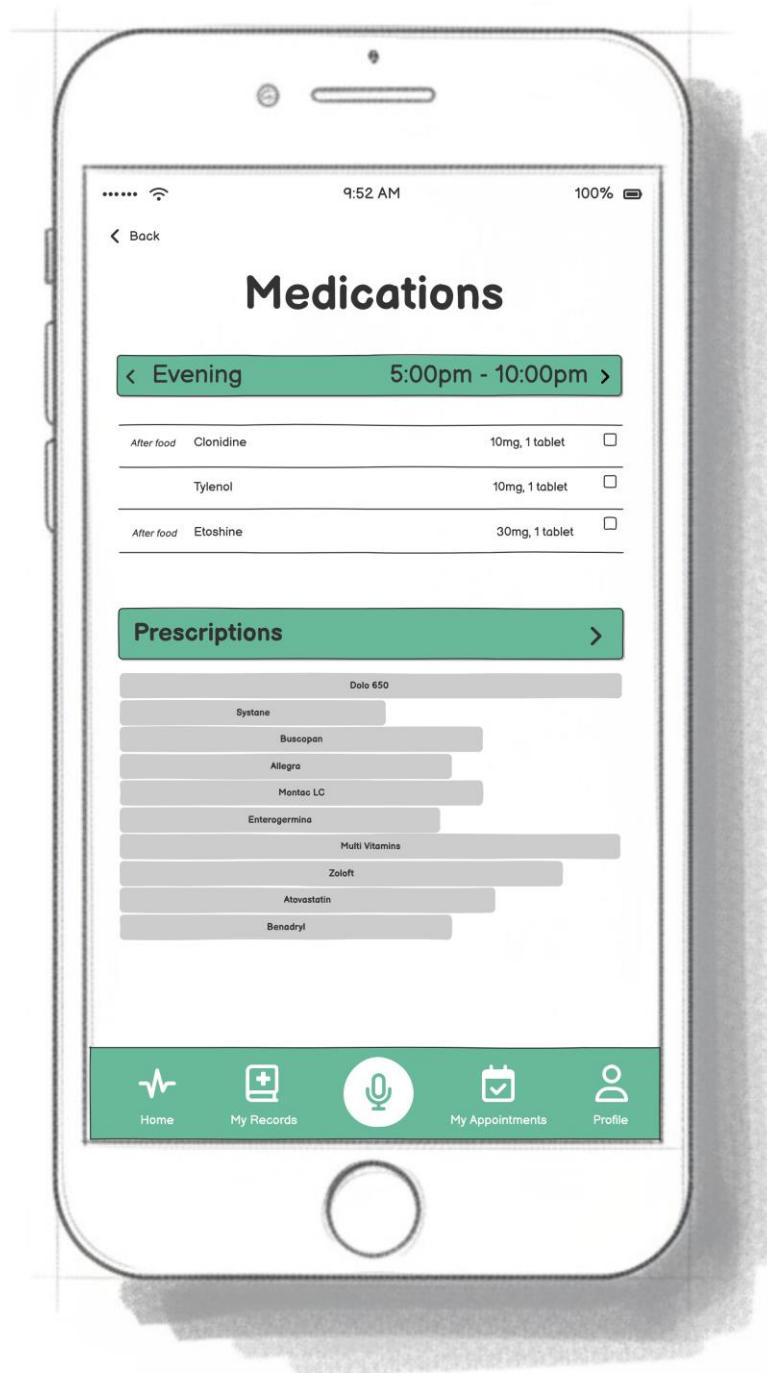

Screen6 My Appointments: John clicked on 'My Appointments' in the navigation bar to view what his month looks like. This calendar is automatically populated based on upcoming appointments, but John can add events to it manually by clicking on the date. He can click on the arrows to change the month. The 'Daily', 'Weekly', and 'Monthly' options let him change the calendar view (monthly is the default option). He can sync with his Google Calendar.

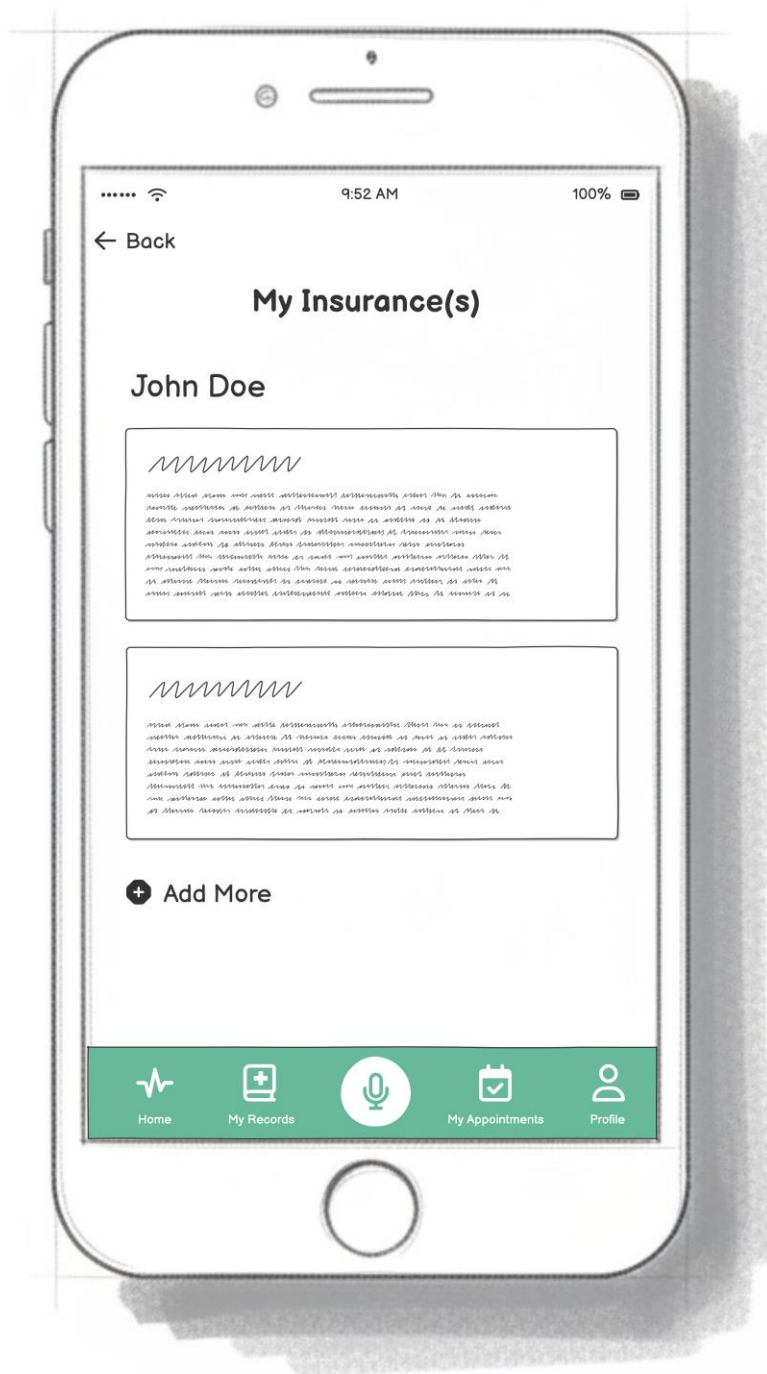

Screen7 AI Scribing: John clicked on the mic icon in the navigation bar and reached the AI scribing screen. He clicked on the big mic icon in the middle of the screen and is narrating his symptoms to prepare for his next appointment, he is viewing the live transcription of his recording as he speaks, and this is being auto-saved for him. Once he completes the recording, he can view this recording and navigate to its AI summary from the ‘All Scribes’ section.

Screen8 Health Data: John clicked on the 'Home' button on the navigation bar and clicked on "Health Data" in the Quick Access section to view his health data since last recorded, these fields are auto-populated using AI based on records from previous appointments. In the near future, a feature will be introduced to choose the name and view their child's health data, too.

Screen9 Medications: John clicked on 'Medications' in the Quick Access section on the Main screen and reached this screen. Based on the time of the day, the screen opens on the medications, he can see his upcoming medication in that part of the day (his child's medication would also be visible to him here with the child's name italicized in the line, like other information such as 'after food' and dosage). He can check off the medication once done. He can use the arrows to switch between time of the day (morning, afternoon, evening). The sections are auto-populated using their prescription records, which are available here as well as in 'My Records'. 'Prescriptions' would let them view prescription files. The medicines listed under it are the current ongoing medication and course tracker.

Screen10 My Insurance: John navigated to this screen by going to ‘Home’ and clicking on ‘My Insurance’ in the Quick Access section. He can view his and his child’s insurance cards here. He can also add more insurance cards, and link them to the MediVault account.
